Klaus Nehring and Clemens Puppe

## Motivation

• Majoritarian choice under 'ambiguous' beliefs about voters' prefs.

#### • Frugal aggregation model:

- Information about individual top choices.
- Ambiguous beliefs about underlying complete preferences.

#### • Ex-ante Condorcet approach:

• Every pair of alternatives induces possible expected majorities...

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

- ... and thus yields ex-ante net majority tournament.
- Complete ignorance about ex-post preferences.
- Maximal elements: 'Ex-ante Condorcet winners.'
- Applications: budget allocation ('participatory budgeting'), spatial voting, collective choice in space of characteristics.
- Different assumptions on the epistemic state of social evaluator:
  - Plain convexity
  - Symmetry

Klaus Nehring and Clemens Puppe

# Motivation

- Maximal elements: 'Ex-ante Condorcet winners.'
- Applications: budget allocation ('participatory budgeting'), spatial voting, collective choice in space of characteristics.
- Different assumptions on the epistemic state of social evaluator:
  - Plain convexity  $\rightarrow$  generic plurality winner.
  - Symmetry  $\rightarrow$  (strict) Tukey median.

Klaus Nehring and Clemens Puppe

## Relation to Literature

- Frugal aggregation as opposed to
  - (i) standard *Arrovian preference aggregation* on economic domains (Le Breton & Weymark, 2004), and
  - (ii) standard *spatial voting* (Austen-Smith & Banks, 1999) (which is a degenerate special case).
- (Non-Bayesian) preference aggregation under incomplete information (Boutilier & Rosenschein, 2016; Lang, 2020).
- Decision making under complete ignorance (Luce & Raiffa, 1957; Nehring, 2000; 2009).
- Participatory budgeting (Aziz & Shah, 2020, Goel et al., 2019; Freeman et al., 2021).

(日) (同) (三) (三)

## Background: Pref. Aggregation on Economic Domains

- Consider a *common* restricted domain D<sub>i</sub> = D ⊆ R on some set of alternatives X, where R is the set of all weak orders.
- $\mathcal{D}$  has the **free triple** property if the restriction of  $\mathcal{D}$  to any triple of distinct alternatives is unrestricted.
- Proposition If D has the free triple property, then every social welfare function F : D<sup>n</sup> → R satisfying IIA and WP is dictatorial.

## Background: Pref. Aggregation on Economic Domains

- Consider a *common* restricted domain D<sub>i</sub> = D ⊆ R on some set of alternatives X, where R is the set of all weak orders.
- $\mathcal{D}$  has the **free triple** property if the restriction of  $\mathcal{D}$  to any triple of distinct alternatives is unrestricted.
- Proposition If D has the free triple property, then every social welfare function F : D<sup>n</sup> → R satisfying IIA and WP is dictatorial.
- Example: Let X ⊆ ℝ<sup>L</sup> be convex, and consider the space of all convex preferences D<sub>co</sub> on X. This domain does not have the free triple property.

#### Background: Pref. Aggregation on Economic Domains

- Consider a *common* restricted domain D<sub>i</sub> = D ⊆ R on some set of alternatives X, where R is the set of all weak orders.
- $\mathcal{D}$  has the **free triple** property if the restriction of  $\mathcal{D}$  to any triple of distinct alternatives is unrestricted.
- Proposition If D has the free triple property, then every social welfare function F : D<sup>n</sup> → R satisfying IIA and WP is dictatorial.
- Example: Let X ⊆ ℝ<sup>L</sup> be convex, and consider the space of all convex preferences D<sub>co</sub> on X. This domain does not have the free triple property.
- Proposition Suppose X ⊆ ℝ<sup>L</sup>, and for all distinct a, b ∈ X, there is c ∈ X such that {a, b, c} is not collinear (note: ⇒ L > 1); then, every social welfare function F : D<sup>n</sup><sub>co</sub> → R satisfying IIA and WP is dictatorial (follows from Kalai, Muller & Satterthwaite, 1979).

# Background: (No) Condorcet Winners in Spatial Voting

 Standard spatial voting assumes that X ⊆ ℝ<sup>L</sup> and that voters have Euclidean preferences, i.e. a voter with top θ<sub>i</sub> has utility function

$$u_{\theta_i}(x) = -(||x - \theta_i||_2)^2 = -(x - \theta_i)^T \cdot (x - \theta_i).$$

Geometrically, voters have *circles* as indifference curves.

Klaus Nehring and Clemens Puppe

## Background: (No) Condorcet Winners in Spatial Voting

 Standard spatial voting assumes that X ⊆ ℝ<sup>L</sup> and that voters have Euclidean preferences, i.e. a voter with top θ<sub>i</sub> has utility function

$$u_{\theta_i}(x) = -(||x - \theta_i||_2)^2 = -(x - \theta_i)^T \cdot (x - \theta_i).$$

 $\bullet \theta_3$ 

Geometrically, voters have *circles* as indifference curves.

• Condorcet winners?

 $\theta_1$ 

Klaus Nehring and Clemens Puppe

# Background: (No) Condorcet Winners in Spatial Voting

 Standard spatial voting assumes that X ⊆ ℝ<sup>L</sup> and that voters have Euclidean preferences, i.e. a voter with top θ<sub>i</sub> has utility function

$$u_{\theta_i}(x) = -(||x - \theta_i||_2)^2 = -(x - \theta_i)^T \cdot (x - \theta_i).$$

Geometrically, voters have *circles* as indifference curves.

Thus, a 
$$\succ_{\mathrm{Maj}}$$
 b, b  $\succ_{\mathrm{Maj}}$  c, c  $\succ_{\mathrm{Maj}}$  a!

Klaus Nehring and Clemens Puppe

## Background: (No) Condorcet Winners in Spatial Voting

- Hence, in the above situation, **every** element of {*a*, *b*, *c*} beats **any other** element of {*a*, *b*, *c*} via a *majority path*.
- Proposition (McKelvey, 1976) Generically, every x ∈ X beats every y ∈ X along some majority path in the standard spatial voting model.
- This negative result has been significantly generalized to the case of general continuous preferences and voting procedures beyond pairwise majority comparisons by McKelvey (1979).
- Upshot: In spatial voting, Condorcet winners fail to exist almost always. And even worse, generically an agenda setter can induce every alternative as the winner of a sequential majority vote by choosing an appropriate sequence of intermediate comparisons ('McKelvey-Schofield Chaos Theorem').

### Agenda

#### 2 The Ex-Ante Condorcet Approach

3 Plain Convexity

4 Symmetric Priors: The Tukey Median

Klaus Nehring and Clemens Puppe

## The Ex-Ante Condorcet Approach

- $X = \{x, y, ...\}$  abstract space of alternatives.
- $\theta = (\theta_1, ..., \theta_n) \in X^n$  known profile of (unique) top choices.
- π prior belief over underlying profile (≽1,..., ≽n) of complete ('ex-post') preferences on X.
- Π convex set of priors: social evaluator's ambiguous beliefs.
   E.g. X ⊆ ℝ<sup>L</sup>, Π<sub>co</sub> all priors over profiles of convex preferences.
- $(\theta, \Pi)$  epistemic state of social evaluator.
- Every  $\pi$  induces expected majority count for all  $x, y \in X$ :

$$m_{(\theta,\pi)}(x,y) := E_{\pi}[\#\{i: x \succ_i y\}].$$

• Every ambiguous belief  $\Pi$  thus induces interval of possible expected majority margins  $\left[m_{(\theta,\Pi)}^{-}(x,y), m_{(\theta,\Pi)}^{+}(x,y)\right]$ .

# Ex-Ante Condorcet Winners

• The ex-ante majority relation is defined by

$$egin{aligned} & xR_{( heta,\Pi)}y & :\iff & m^-_{( heta,\Pi)}(x,y) \geq m^-_{( heta,\Pi)}(y,x) \ & \iff & m^+_{( heta,\Pi)}(x,y) \geq m^+_{( heta,\Pi)}(y,x). \end{aligned}$$

- Majority intervals may overlap but are unambiguously ordered.
  - Choice based on α min +(1 α) max ('Hurwicz pessimism optimism index,' Luce & Raiffa) independent of α.
  - Independent of ambiguity attitude.
- Ex-ante Condorcet winners:

$$CW(\theta, \Pi) := \{ x \in X \mid xR_{(\theta, \Pi)}y \text{ for all } y \in X \}.$$

• Main finding: in interesting cases, ex-ante CWs exist even if ex-post CWs fail to exist (e.g. in standard spatial voting).

## Simple Examples

- Unrestricted beliefs:  $\Pi_{\rm univ}$ 
  - $xP_{(\theta,\Pi)}y$  iff more agents have top at x than top at y.
  - $CW(\theta, \Pi) =$ plurality winners.

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへの

## Convexity of Preferences

 Suppose Π<sub>co</sub> consists of all possible priors on profiles of individually convex preferences ('plain convex model').

#### Proposition

If individual tops  $\{\theta_1, ..., \theta_n\}$  are in general position (no three collinear), then  $CW(\theta, \Pi_{co})$  contains all plurality winners. Moreover, if there is a unique plurality winner  $\theta_{i^*}$ , then  $CW(\theta, \Pi_{co}) = \{\theta_{i^*}\}.$ 

Klaus Nehring and Clemens Puppe

## Conundrum

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 – 釣��

Klaus Nehring and Clemens Puppe

## Conundrum

- Tops randomly drawn from U (in particular, in general position).
- Convexity gives no info about pref between y and x.
- With duplication, ex-ante Condorcet winner is x.
- In fact, possibly **all** voters with top in *U* prefer *x* to *y*.
- But alternative x's claim for winner is like 'grasping at straws.'
- Indeed, prefs must be very specifically and individually tailored.

### Quadratic Model as Approximation of Convex Model

 $\Pi_{\rm quad}$  set of all priors on profiles of quadratic preferences.

#### Proposition

 $\begin{array}{l} \Pi_{\rm quad} \ \mbox{induces same ex-ante majority relation as } \Pi_{\rm co}. \ \mbox{In particular,} \\ {\rm CW}(\theta,\Pi_{\rm quad}) = {\rm CW}(\theta,\Pi_{\rm co}). \end{array}$ 

Klaus Nehring and Clemens Puppe

(日) (同) (日) (日)

## The Symmetric Quadratic Model

- Quadratic model allows one to formulate above intuition that "tops contain no info about preference structure" as follows:
- A prior  $\pi$  on profiles of quadratic preferences is **symmetric** if, for all *i*, *j*,

$$\pi_{\mathcal{Q}_i} = \pi_{\mathcal{Q}_j}.$$

Π<sup>sym</sup><sub>quad</sub> set of all symmetric priors on profiles of quadratic preferences.

#### Question

$$CW(\theta, \Pi_{quad}^{sym})$$
 ?

Klaus Nehring and Clemens Puppe

### Strict Tukey Median and Main Result

• Denote by 
$$\mathcal{H}^*_x := \{H \ni x : \#(\theta \cap H) = \mathfrak{d}(\theta)\}$$
 and let

 $T^*(\theta) := \{x \in T(\theta) \mid \text{ for no } y \in T(\theta), \ \mathcal{H}^*_y \subsetneq \mathcal{H}^*_x\}.$ 

• By construction, 
$$T^*(\theta) \subseteq T(\theta)$$
.

• 
$$T^*(\theta)$$
 strict Tukey median.

#### Theorem

For all profiles  $\theta$ , the strict Tukey median is non-empty and

$$CW(\theta, \Pi_{quad}^{sym}) = T^*(\theta).$$

Klaus Nehring and Clemens Puppe

イロト イヨト イヨト イヨト

## Sketch of Proof

#### Step 1

The symmetric quadratic model  $\Pi_{quad}^{sym}$  induces the same ex-ante majority relation as the **uniform** quadratic model  $\Pi_{quad}^{unif}$  consisting of all priors that assign full mass to uniform profiles

### $[(\theta_1, Q), (\theta_2, Q), ..., (\theta_n, Q)]$

for some <u>common</u> quadratic from Q.

Klaus Nehring and Clemens Puppe

イロト イ団ト イヨト イヨト

æ

# Sketch of Proof

#### Step 2

This implies that, under symmetry, the ex-ante majority relation coincides locally with **relative Tukey depth**:

$$xR_{(\theta,\mathrm{Tuk})}y \iff \min_{H\ni x, H
ightarrow y} \#(\theta\cap H) \ge \min_{H\ni y, H
ightarrow x} \#(\theta\cap H).$$

Klaus Nehring and Clemens Puppe

# Sketch of Proof

#### Step 2

This implies that, under symmetry, the ex-ante majority relation coincides locally with **relative Tukey depth**:

$$xR_{(\theta,\mathrm{Tuk})}y \iff \min_{H \ni x, H \not\ni y} \#(\theta \cap H) \ge \min_{H \ni y, H \not\ni x} \#(\theta \cap H).$$

Observe that this solves above conundrum:

Klaus Nehring and Clemens Puppe

# Sketch of Proof

#### Step 2

This implies that, under symmetry, the ex-ante majority relation coincides locally with **relative Tukey depth**:

$$xR_{(\theta,\mathrm{Tuk})}y \iff \min_{H \ni x, H \not\ni y} \#(\theta \cap H) \ge \min_{H \ni y, H \not\ni x} \#(\theta \cap H).$$

Observe that this solves above conundrum:

## Sketch of Proof

#### Step 3

Now show that the strict Tukey median consists of the maximal elements of the relative Tukey depth:

$$T^*( heta) \;=\; \left\{ x \in X : x extsf{R}_{( heta, \mathrm{Tuk})} y extsf{ for all } y \in X 
ight\}.$$

#### Step 4

Finally, show that  $\{x \in X : xR_{(\theta, Tuk)}y \text{ for all } y \in X\}$  is non-empty by appeal to Zorn's Lemma.

## The Separably Convex Model

*Example:* All pref's representable by  $u(x) = \sum_{\ell} u^{\ell}(x^{\ell})$  with concave  $u^{\ell}$ .

Klaus Nehring and Clemens Puppe

## The Separably Convex Model

*Example:* All pref's representable by  $u(x) = \sum_{\ell} u^{\ell}(x^{\ell})$  with concave  $u^{\ell}$ .

#### Observation

x is preferred to y by all voters with top  $\theta_i$  iff x on shortest  $L_1$ -path connecting  $\theta_i$  and y.

Klaus Nehring and Clemens Puppe

#### Global vs.Local Ex-Ante Condorcet Winners

The ex-ante majority relation under separably convex preferences may have cycles between 'distant' alternatives ...

### Separably Convex Model and the $L_1$ -median

#### Definition

The  $L_p$ -median is the choice correspondence that selects, for all profiles  $\theta$ ,

$$\arg\min_{x\in X}\sum_{i=1}^n ||\theta_i - x||_p.$$

#### Theorem

For all  $\theta$ ,

$$CW^{loc}(\theta, \Pi_{sepco}) = L_1$$
-median.
